

S1 · Full link topology · 1

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.

Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

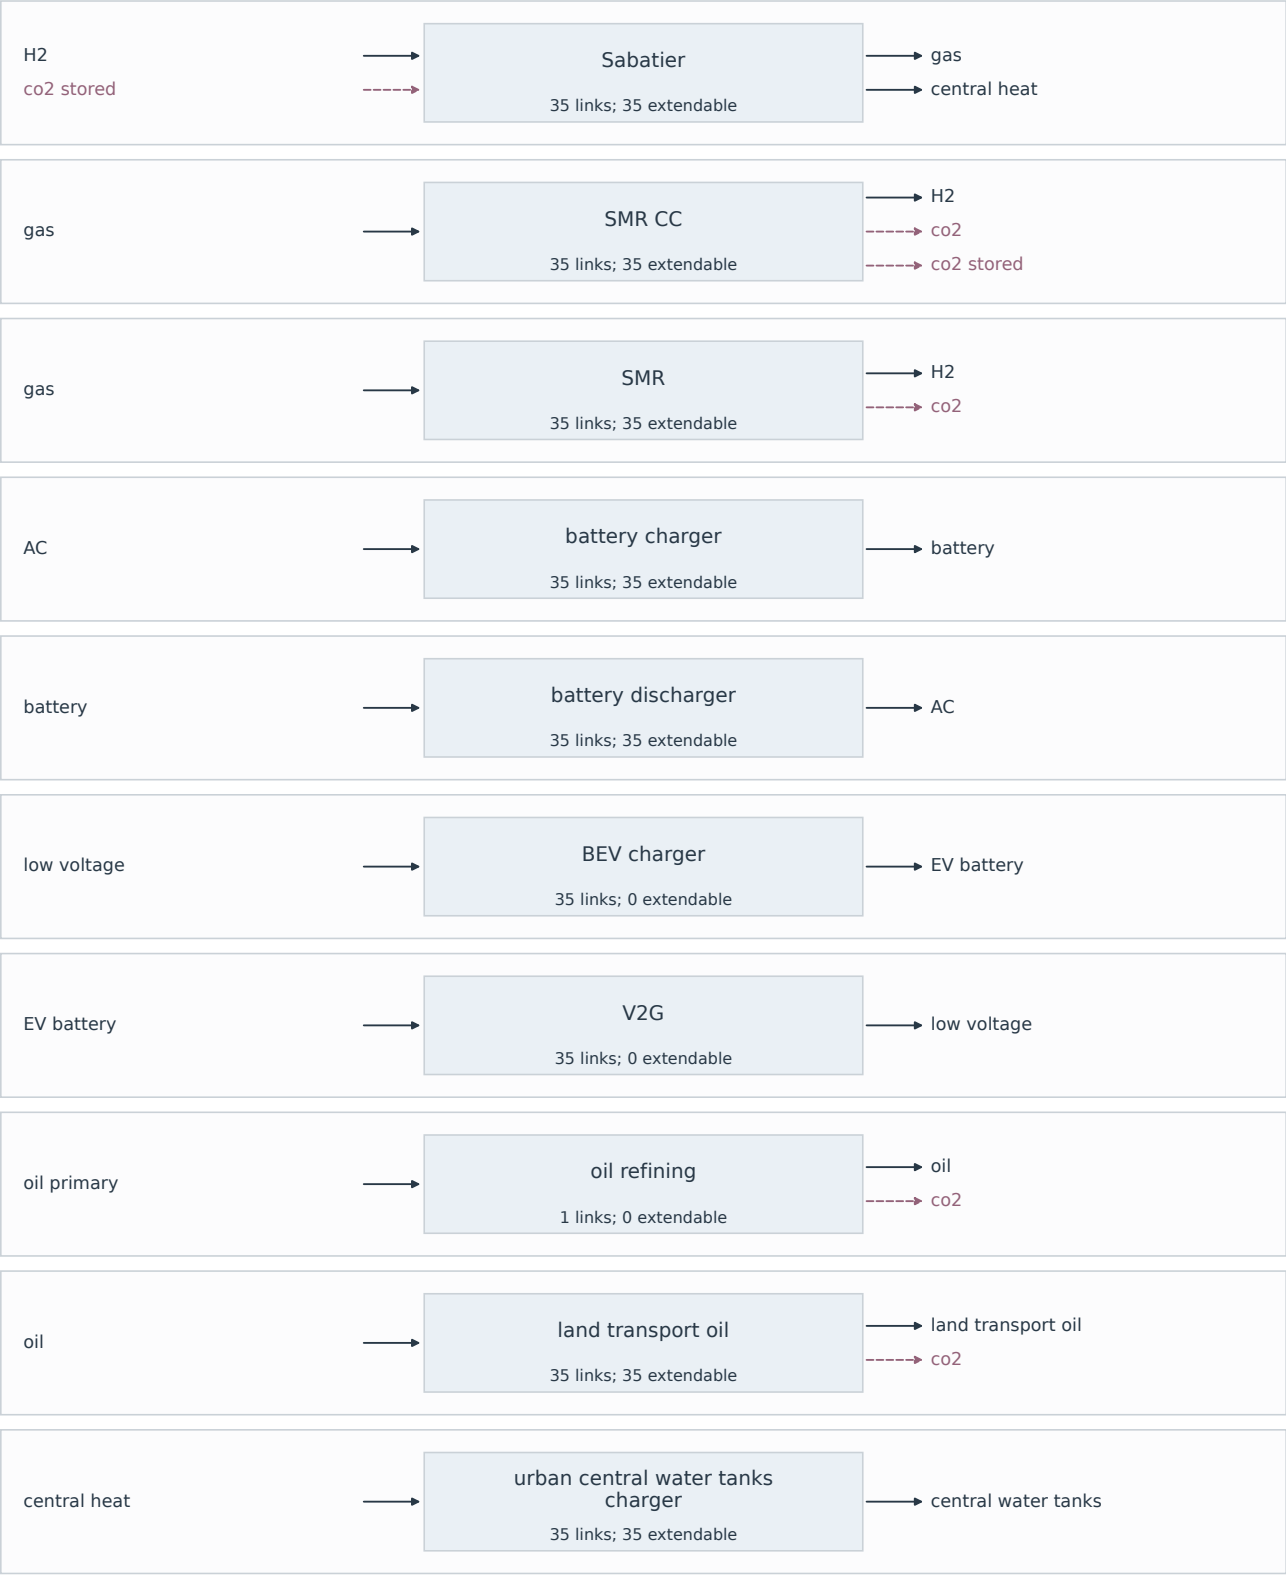

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.

Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 2

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 3

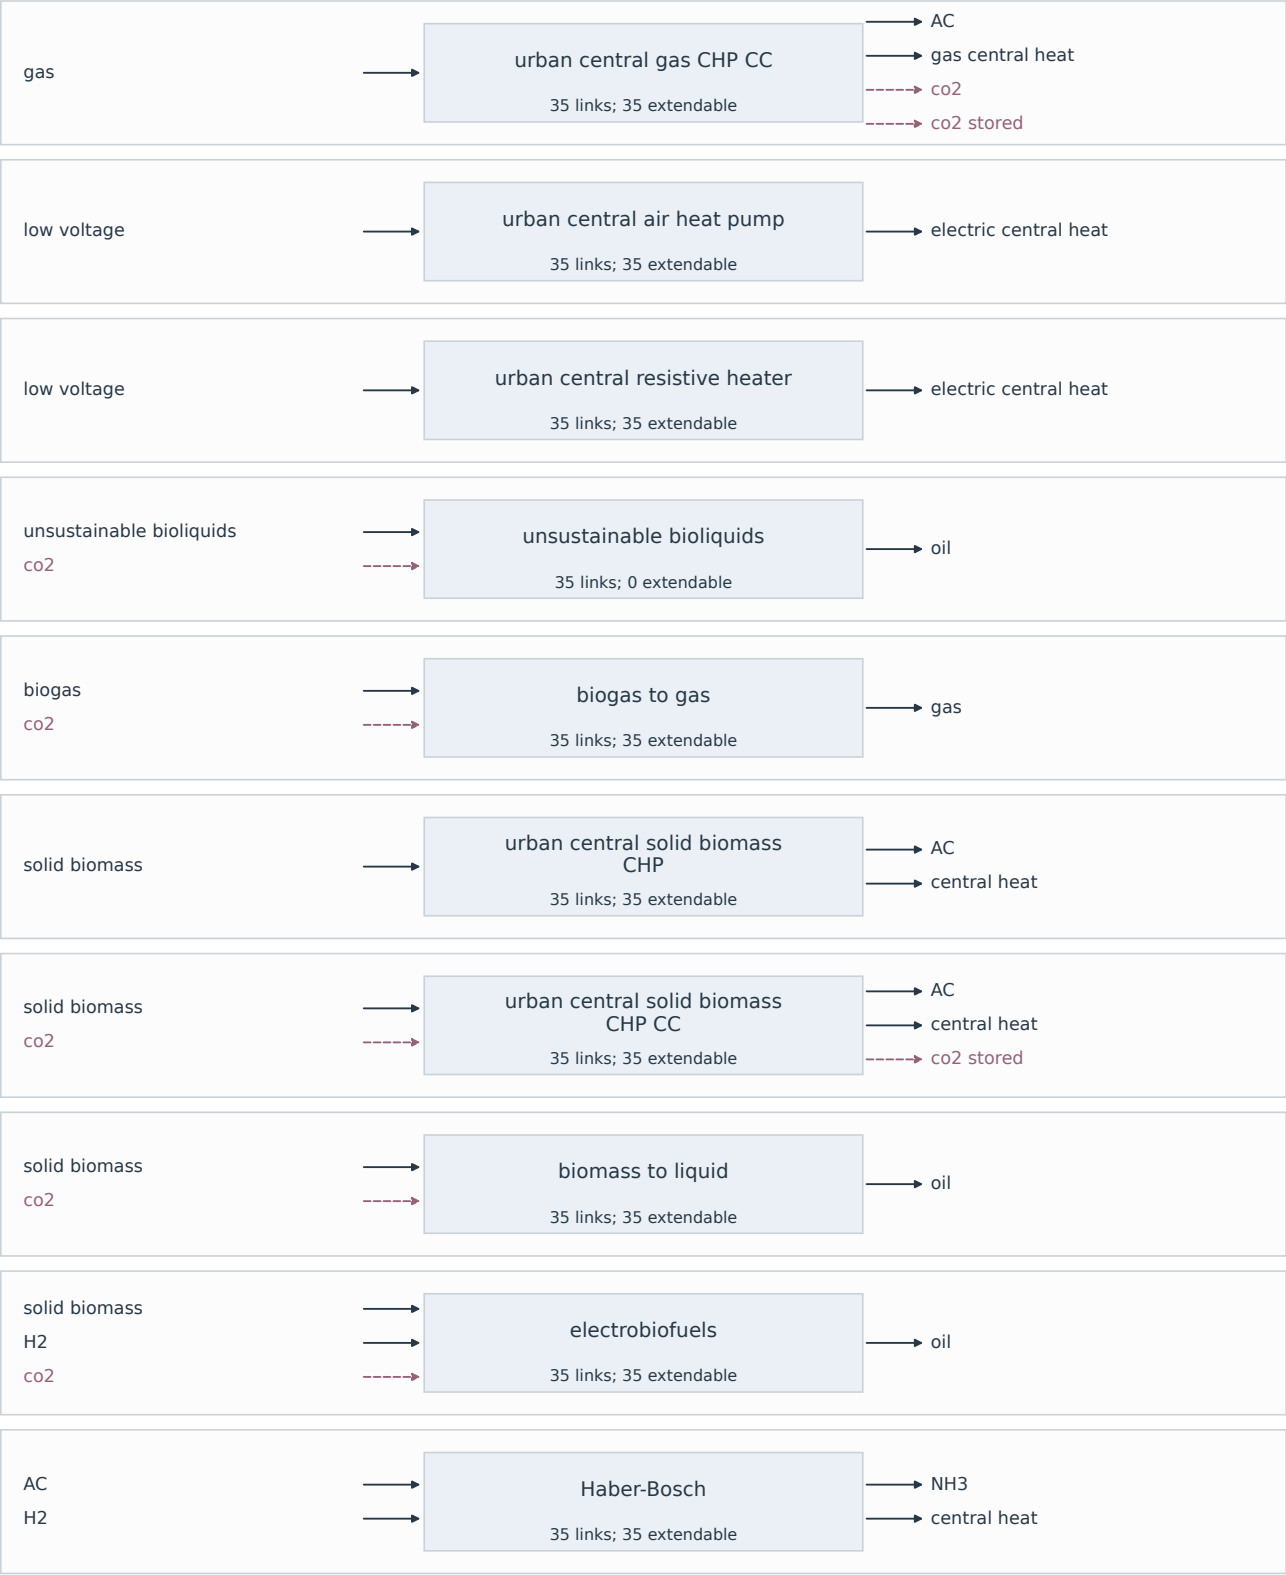

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 4

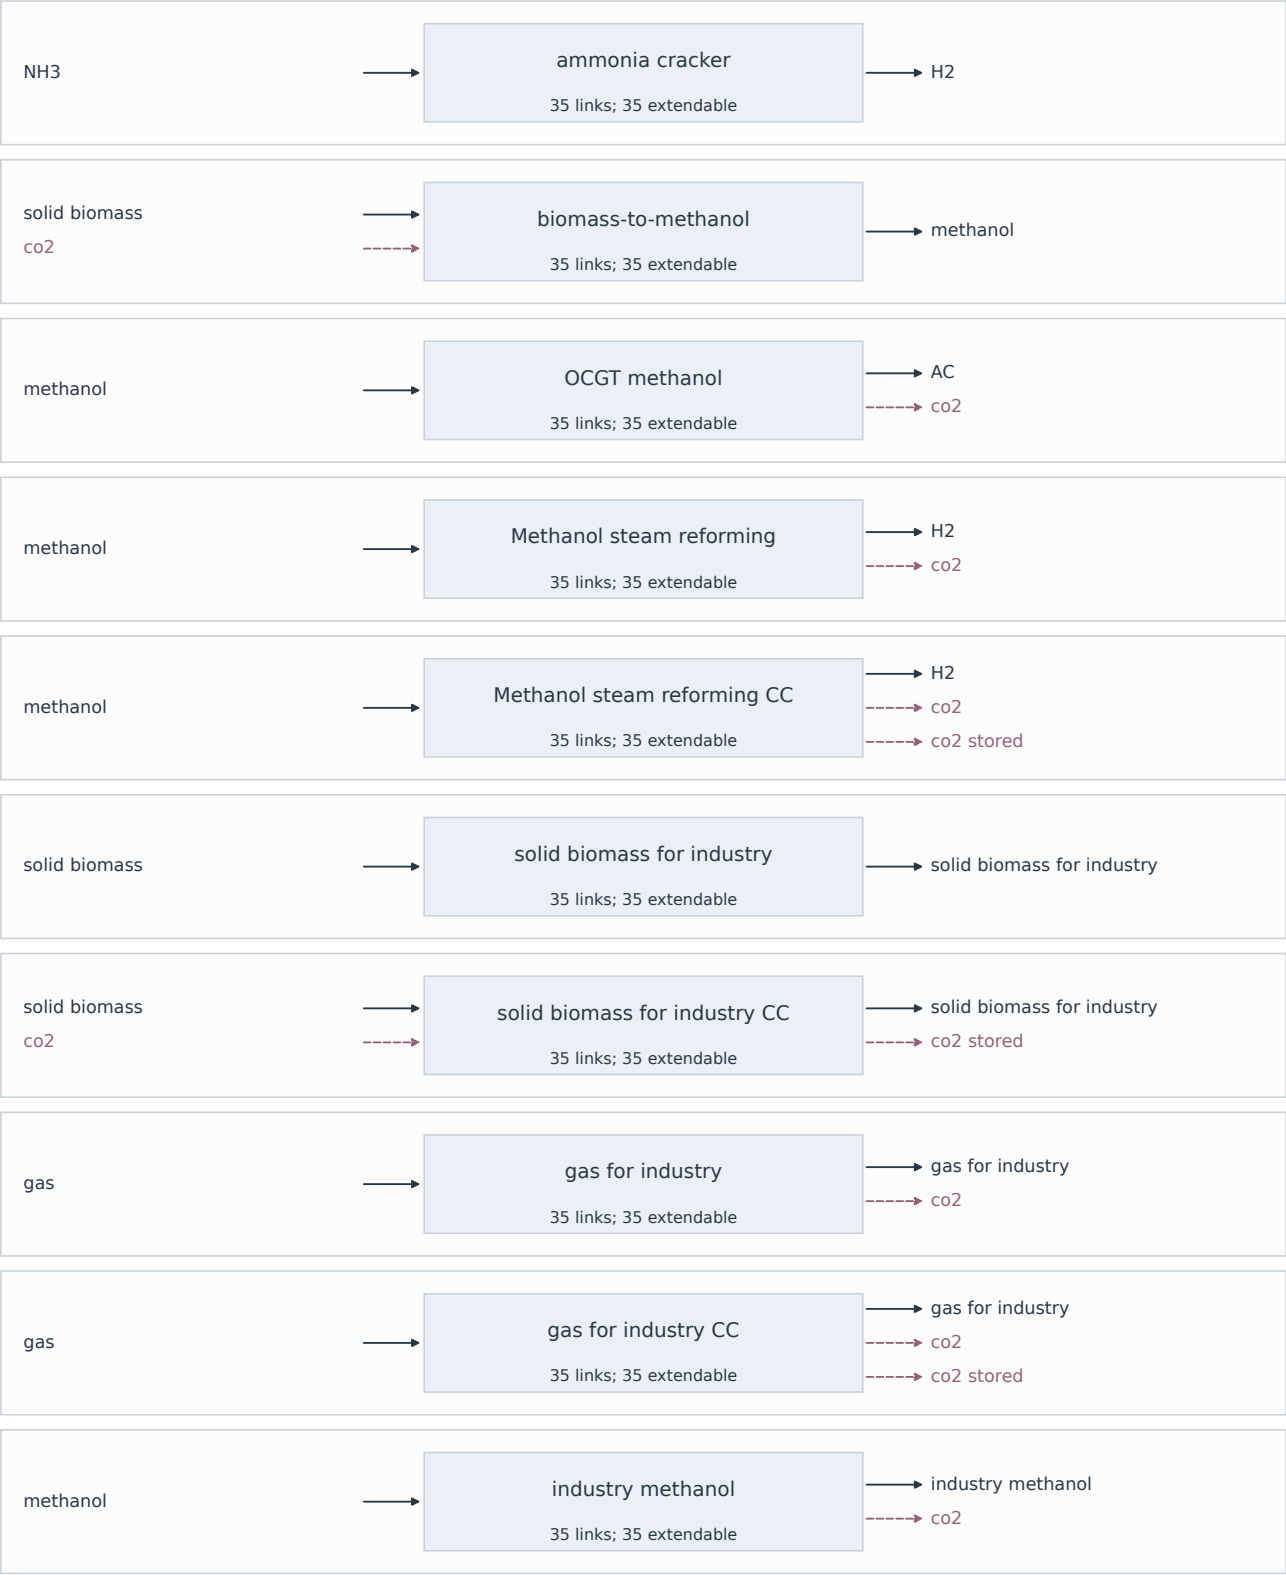

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 5

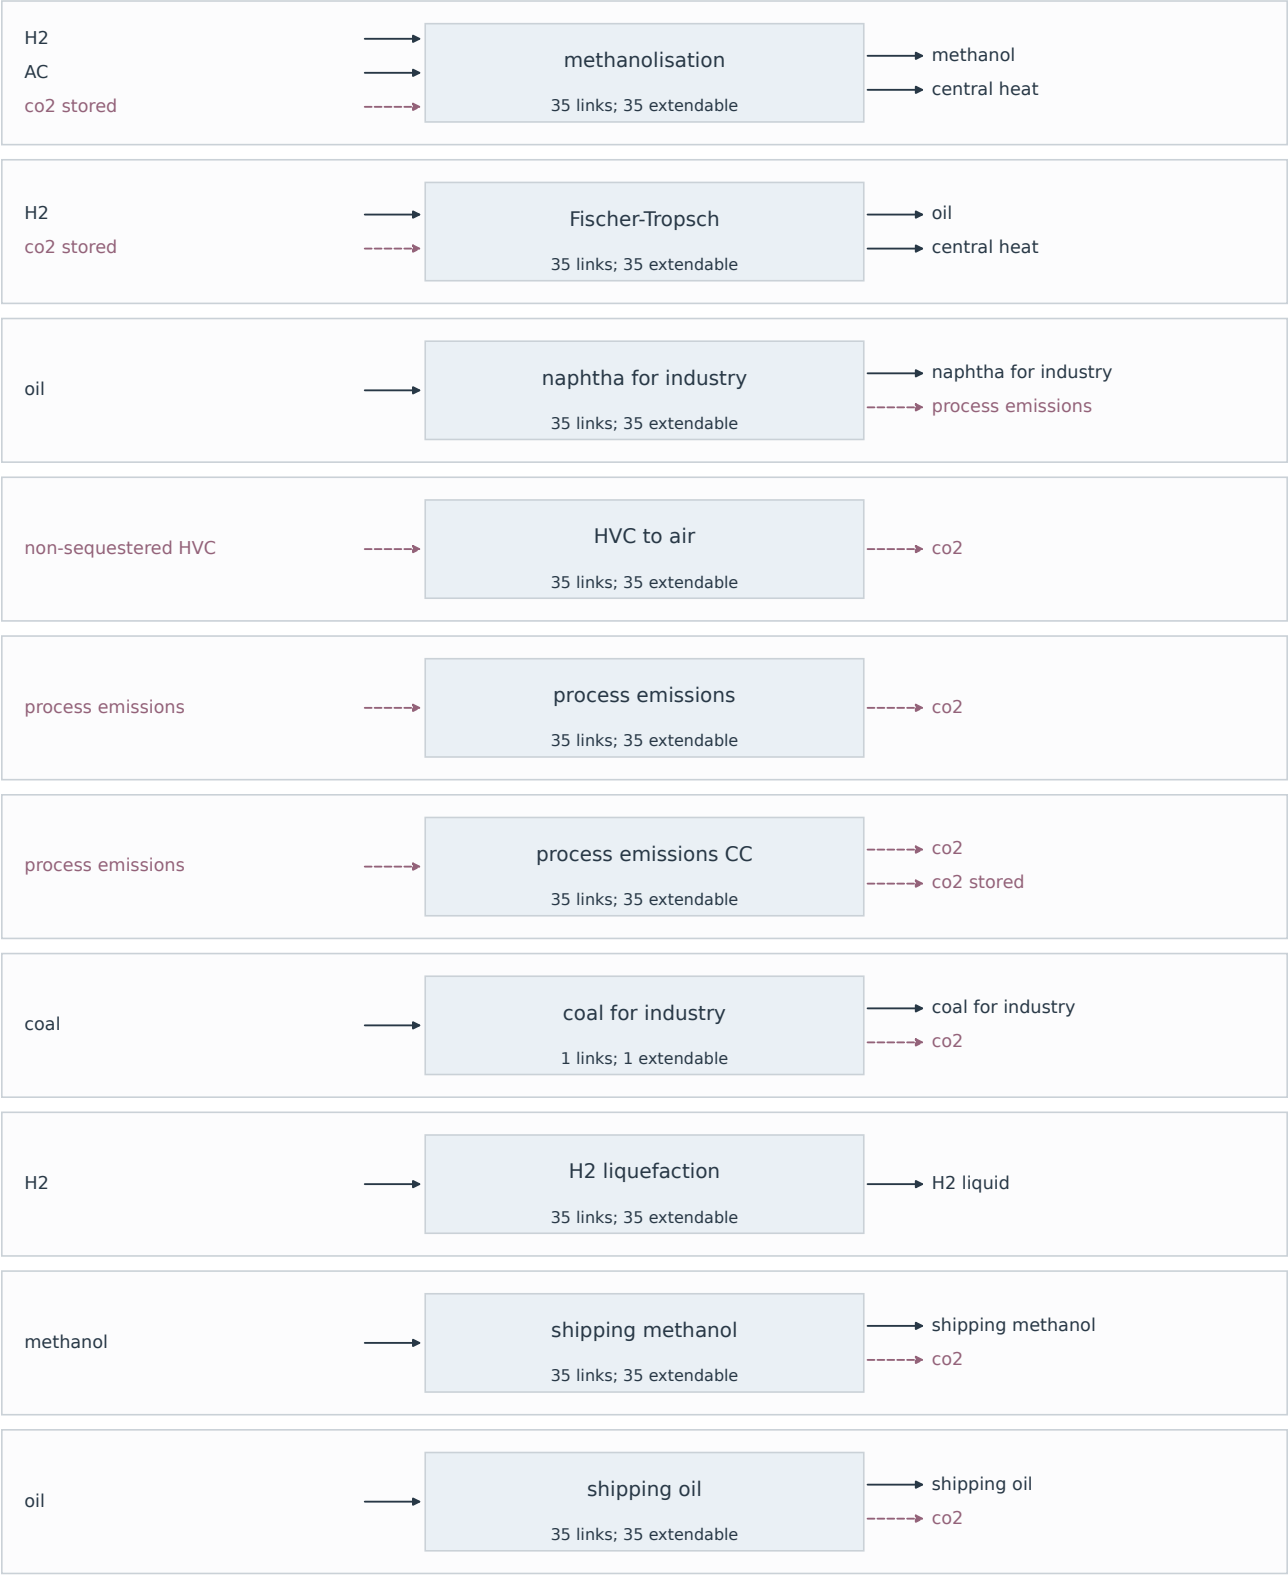

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 6

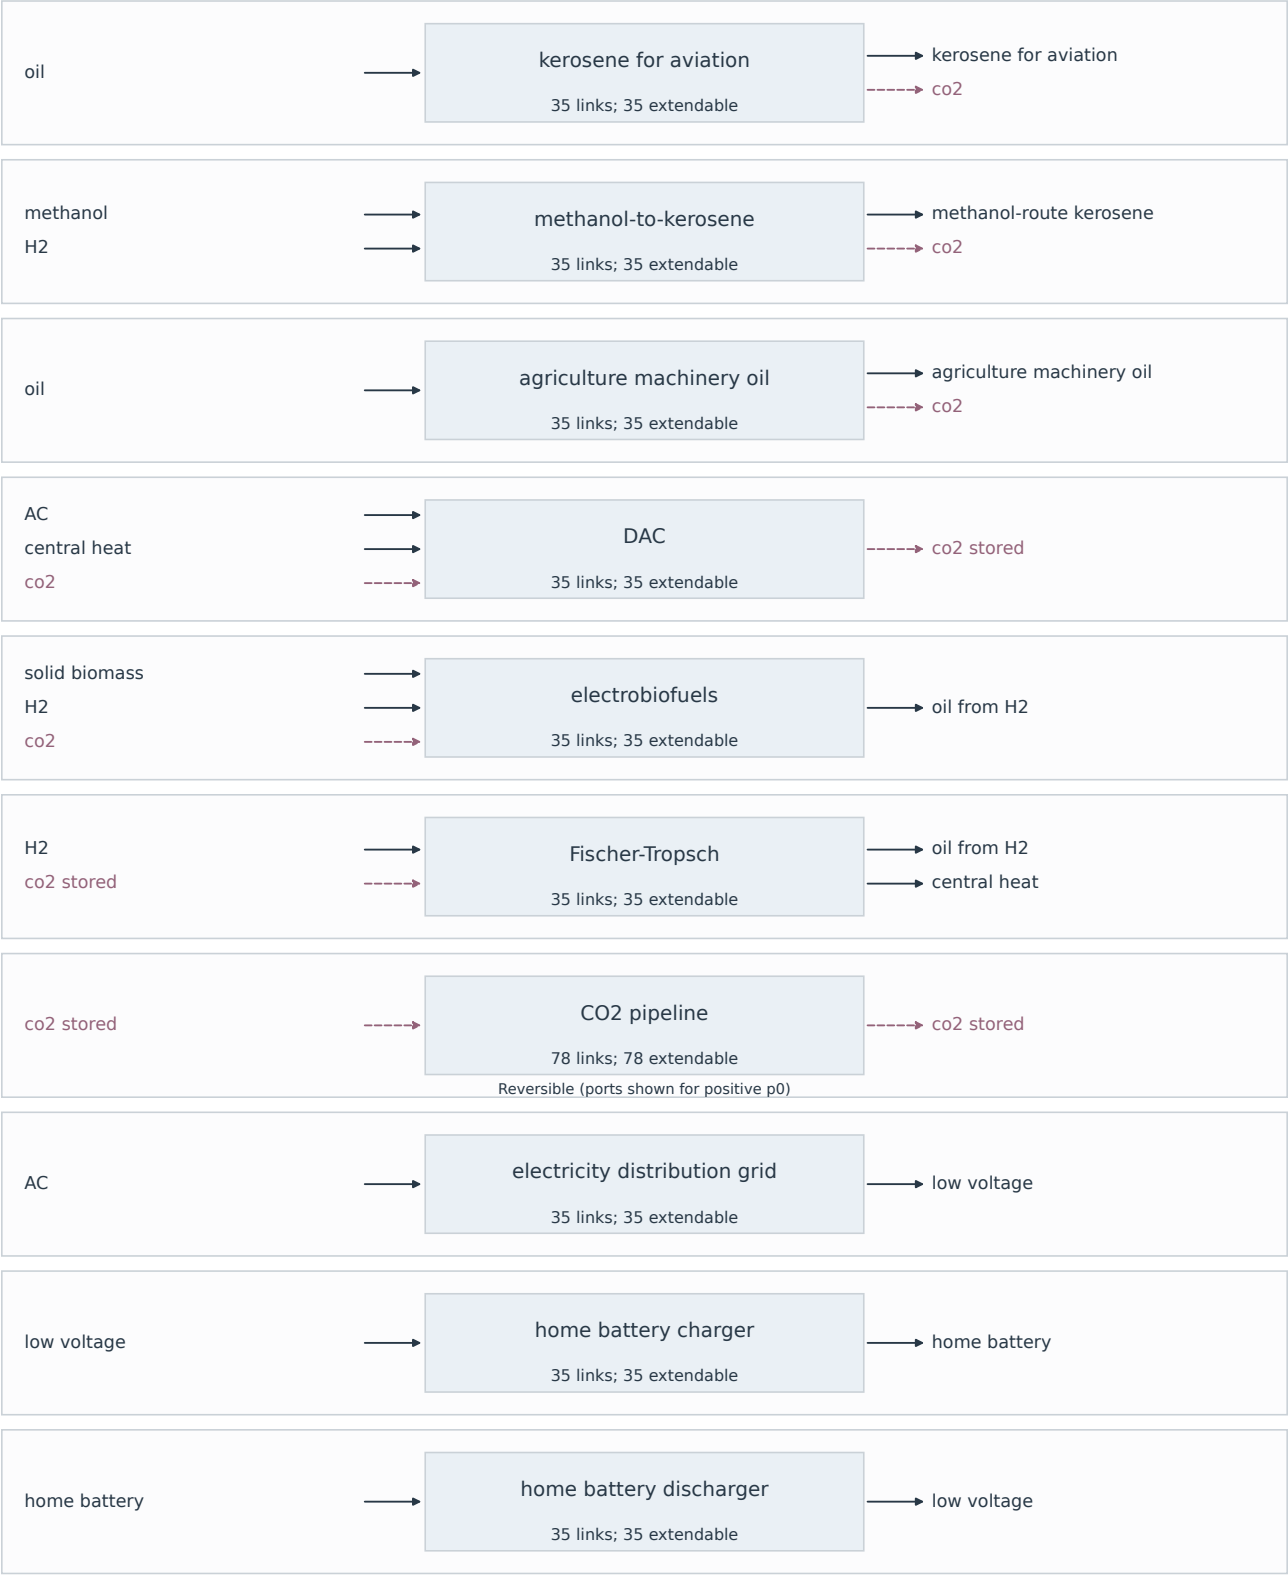

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 7

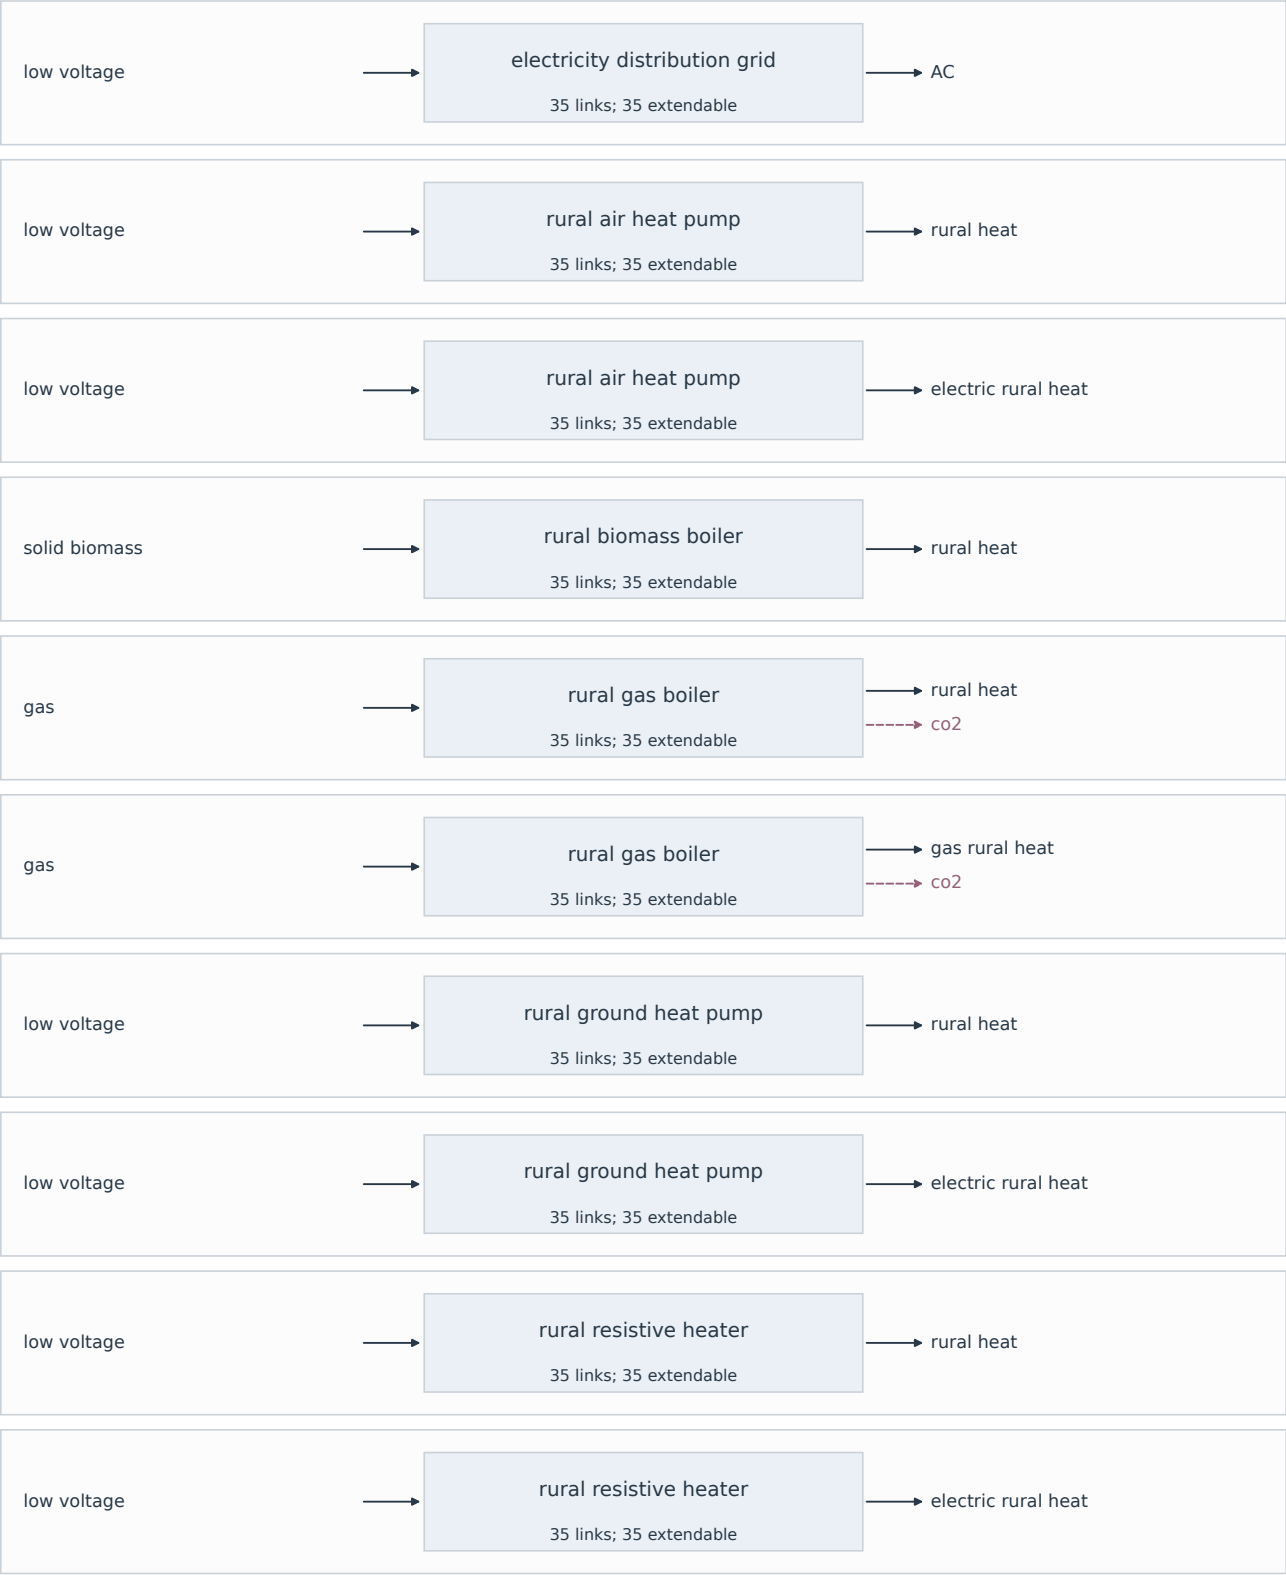

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 8

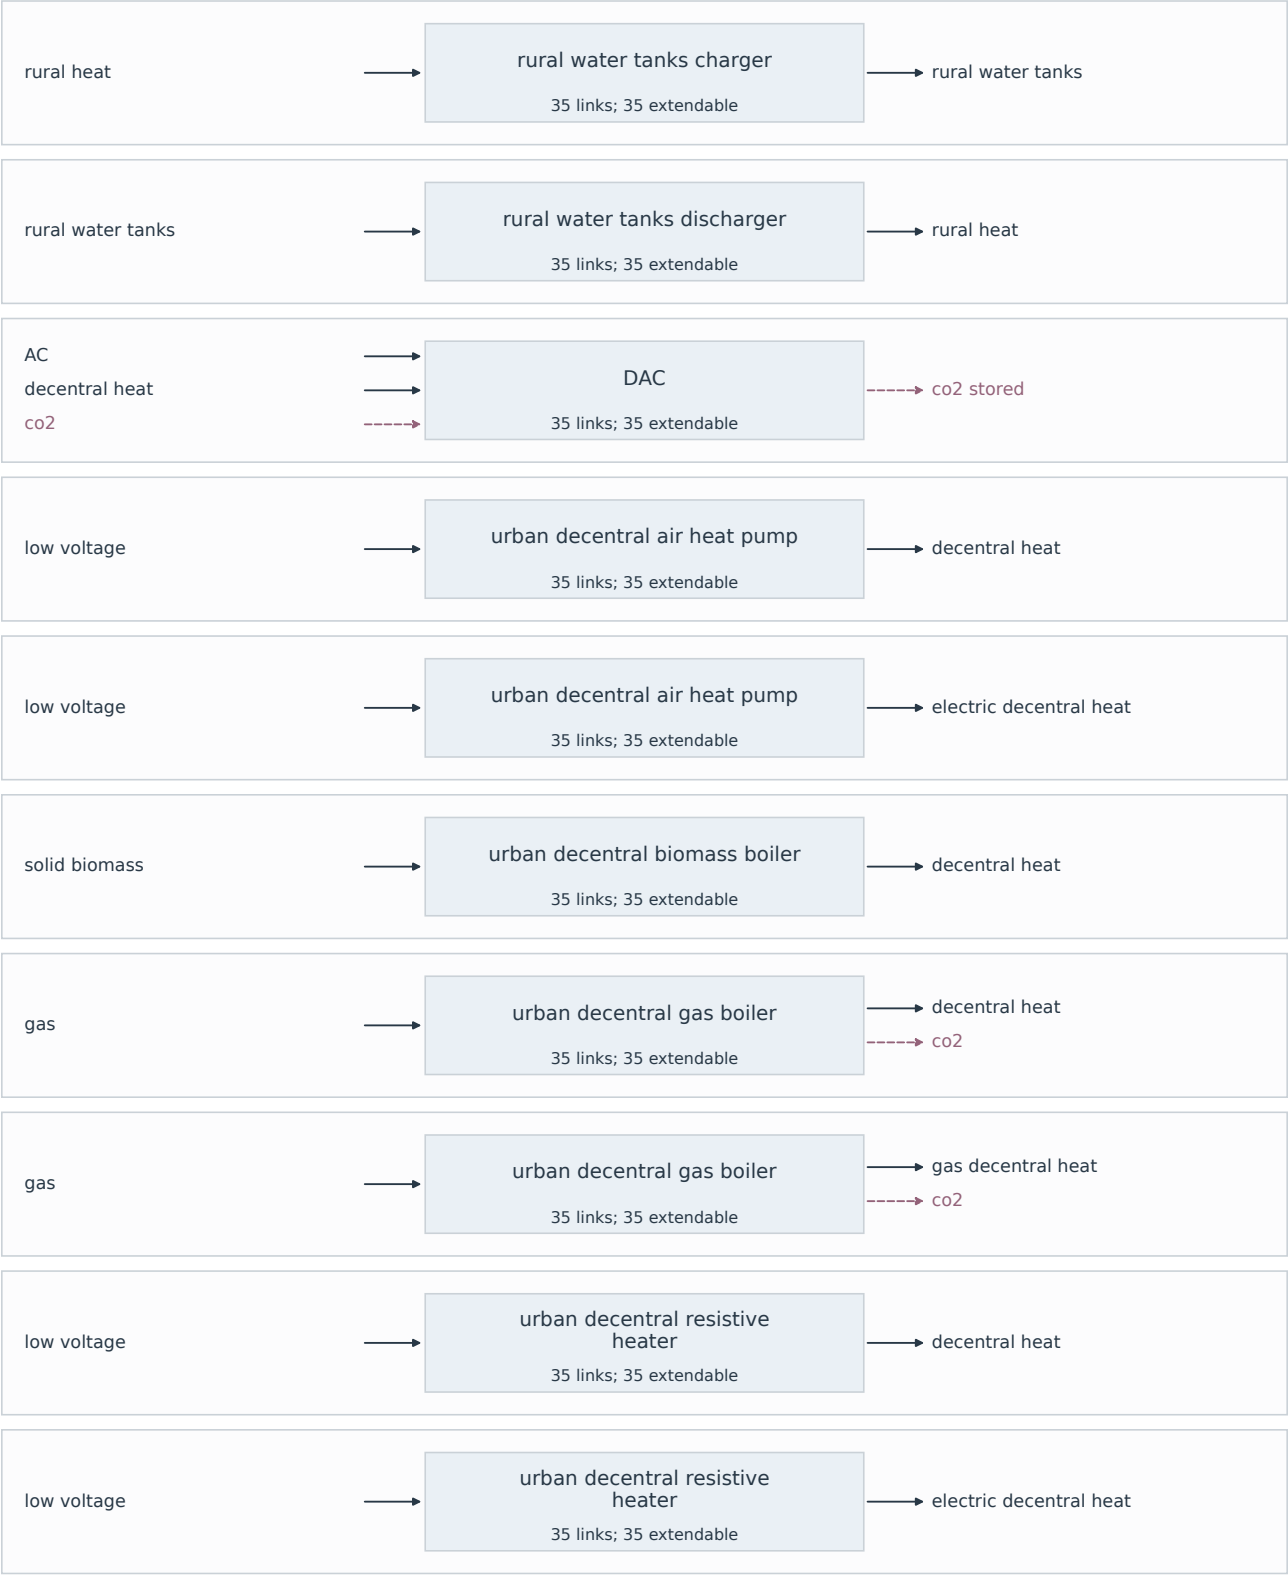

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 9

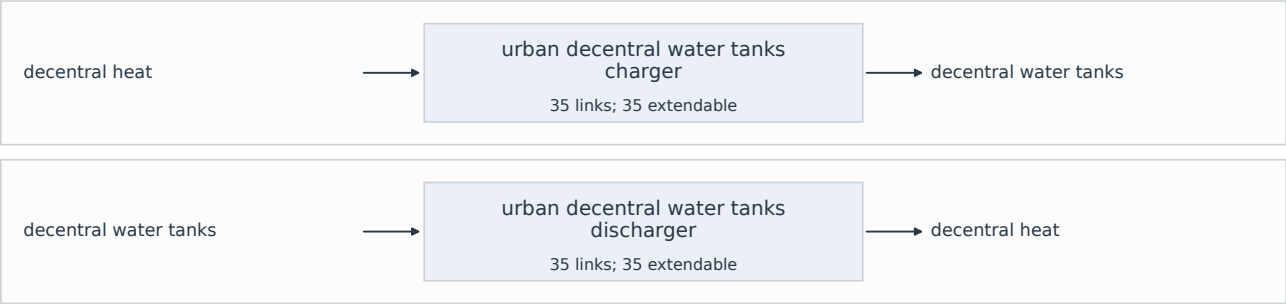

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.

S1 · Full link topology · 10

All populated ports; repeated regional instances grouped. No capacity or dispatch filtering.
Dashed purple: carbon accounting / CO2. Solid: energy. Repeated labels denote the same carrier.

Air CO2 inputs to biomass routes encode biogenic carbon bookkeeping, not DAC energy supply.
Heat-pump arrows use reverse-only bounds and time-dependent efficiency; co-inputs stay coupled.
